Allergies, affecting an increasing population worldwide, are environment related inflammatory diseases, characterised by hypersensitivity reactions of genetic susceptible individuals to different ambient factors.

In a changing environment, with yet undetermined exposome and unknown cross-reactions, discovery of underlying factors of allergic inflammation is highly challenging and involves a multi-disciplinary approach, under "One World, One Health" concept.

This workshop will address subjects on "Aeroallergens and pollution related Allergy", "Food Allergy", "Occupational Allergy" and "Veterinary Allergology".
