Artificial Stress Diffusion Applied to the
Simulations of Oldroyd-B Fluid Flows

Marília Pires

Investigação em Matemática e Aplicações, Instituto de Investigação e Formação
Avançada, Universidade de Évora

Abstract Numerical simulations of Oldroyd-B fluids are a challenging problem for high values of Weissenberg (We), known as the High Weissenberg Number Problem. This problem is characterized by the instability of the numerical solution for higher values than some critical value of the parameter We . One of the technique adopted to stabilize the numerical algorithm is added the stress diffusion term into the transport equations for viscoelastic stress tensor with a special care to keep the modified model consistent with the original problem. In this talk, several variants of artificial diffusion tensor are presented, focusing on practical aspects of its implementation and use.

Joint work with Tomás Bodnár, Faculty of Mechanical Engineering CTU, in Prague.
